

GMO Statement

AAK USA K1/K2, LLC produces vegetable oil products. The label declaration on the product data sheet indicates the source oils used for each product.

Many AAK USA K1/K2 products contain coconut, sunflower, palm kernel and/or palm oils. As of this point in time, to the best of our knowledge and belief, the fruit from which these oils are processed have not been enhanced through bioengineering techniques (genetically modified). The additive sunflower lecithin is also considered naturally non-GMO.

Other AAK products containing ingredients such as soy lecithin, soybean oil, cottonseed oil, or canola may be derived from commercially grown genetically modified (GM) varieties within their respective supply chain. It is important to note that while these oils may be derived from GM varieties, residual DNA/protein is not detectable in these oils when they are fully processed (refined, bleached, and deodorized).

At this time, AAK USA K1/K2, LLC is project verified for one non-GMO soybean oil product. Non-GMO Soy is stored in dedicated tanks to avoid cross contamination with conventional soy.

Due to the dynamic nature of this subject matter, this document and AAK's status will be updated on an annual basis or as deemed necessary to reflect any relevant changes.

If you require, Identity Preserved or Non-GMO certified material, please contact your AAK sales professional.
